Table 1 – Equipment Names and Best Practice Tips – Update September 2018

- Includes equipment terms commonly used by different trades and in different geographic areas.
- ‘Best practice’ tips are intended to help employers and their employees operate the equipment-control options effectively and are based on 1) OSHA’s Small Entity Compliance Guide for the Respirable Crystalline Silica Standard for Construction; 2) OSHA’s Frequently Asked Questions ("FAQs") for the Construction Industry; 3) silica standard’s Table 1; 4) manufacturer specifications; and 5) craft worker/contractor input based on experience in the field.

| (iii) Handheld power saws for cutting fiber-cement board (with blade diameter of 8 inches or less) | ![Photo courtesy of NIOSH](https://www.youtube.com/watch?v=2KlTXdL6TUI) | **CONTROL:** ventilation (local exhaust ventilation or LEV)
For tasks performed outdoors only:
- Use saw equipped with commercially available dust collection system.
- Operate and maintain tool in accordance to manufacturer’s instructions to minimize dust emissions.
- Dust collector must provide the air flow recommended by the tool manufacturer, or greater, and have a filter with 99% or greater efficiency.

**Required Respiratory Protection:**
- ≤4 hours/shift: NONE
- >4 hours/shift: NONE |

- OSHA’s requires the employer to ensure that:
  - The shroud or cowling is intact and installed in accordance with the manufacturer’s instructions
  - The hose connecting the tool to the vacuum is intact and without kinks or tight bends
  - The filter(s) on the vacuum are cleaned or changed in accordance with the manufacturer’s instructions
  - The dust collection bags are emptied to avoid overfilling
  - The air flow rate is equal or greater than recommended by the manufacturer
  - Additional exhaust is provided as needed to minimize the accumulation of visible airborne dust when operating indoors or in an enclosed space (area where airborne dust can build up)
  - Additional means of exhaust could include: portable fans (e.g. box fans, floor fans, axial fans, oscillating fans), portable ventilation systems, or other systems that increase air movement and assist in the removal and dispersion of airborne dust
  - “Indoors or in enclosed areas” refer to any areas where, without the assistance of forced ventilation, the dispersal of airborne dust can be impeded and concentrations can build up. Parking garages, pits, trenches, empty swimming pools, open-top structures with 3 walls, or other structures with limited air movement could be considered enclosed
  - Employers may rely on statements made by the manufacturer of equipment to determine dust collection systems function at the air flow level required. However, employers must properly select, use, maintain, and replace dust collection systems in order to ensure they function as designed

Tips for this tool continued on next page.
A high efficiency disposable filter bag can be used as a prefilter in the shop vacuum to capture most of the dust to prolong the life of the filter cartridge.

- Plug the shop vacuum or saw into intelligent vacuum switches or use a shop vacuum with a built-in intelligent vacuum switch.
- Regularly clean the saw, check and replace the filter, and empty the dust collection unit to prevent clogging and overheating.
- Do not use compressed air to clean the equipment, filters, work clothing, or work environment (compressed air can damage the filter).

Other tips:
- When working indoors, provide sufficient ventilation to prevent build-up of visible airborne dust.
- Visually inspect the blade, hood (shroud or cowl) and the shop vacuum system for missing or damaged parts.
- Check the hood (shroud or cowl) and dust collection system regularly to ensure the system is operating so that no visible dust is emitted from the process once the blade has entered the substrate (material).
- The hose should be of sufficient size (≤1.25-inch inner diameter) to allow adequate airflow for the dust capture and transport, only be as long as necessary, and be kept as straight as possible.
- Visually inspect the blade, hood (shroud or cowl) and shop vacuum system to ensure they are properly connected.

Best practice requirements from OSHA’s Small Entity Compliance Guide for the Respirable Crystalline Silica Standard for Construction.

Respirator use is conditional on time spent using equipment (less than or equal to 4 hours/shift or greater than 4 hours/shift) and if task is done outdoors, indoors or in an enclosed area. See Table 1 in the standard for specific requirements including the assigned protection factor (respiratory protection). The employer does not have to track the exact amount of time that employees are performing a job throughout a shift to be in compliance with Table 1. Before the task is performed, the employer must make a good-faith judgment about whether the task will take more than 4 hours based on previous experience and other available information. At the beginning of the task, the employer must provide the employee the respiratory protection required for the anticipated time the employee will be engaged in the task. However, if unforeseen difficulties or other circumstances are expected to extend the task duration beyond 4 hours, the employer must provide the appropriate respiratory protection as soon as it becomes evident. (In that situation, the 4-hour mark is still measured from the beginning of the task, not from the time the expected duration of the task changes.) See OSHA’s Q&A’s #15 at https://www.osha.gov/dsg/topics/silicacrystalline/construction_info_silica.html.

Respirator use is conditional on time spent using equipment (less than or equal to 4 hours/shift or greater than 4 hours/shift) and if task is done outdoors, indoors or in an enclosed area. See Table 1 in the standard for specific requirements including the assigned protection factor (respiratory protection). The employer does not have to track the exact amount of time that employees are performing a job throughout a shift to be in compliance with Table 1. Before the task is performed, the employer must make a good-faith judgment about whether the task will take more than 4 hours based on previous experience and other available information. OSHA’s Small Entity Compliance Guide for the Respirable Crystalline Silica Standard for Construction.

In August 2018, OSHA released new Q&A’s. These additions are based on information included in the responses. Q&A #11 addresses manufacturer airflow recommendations; #12 addresses use of additional exhaust; #13 addresses indoor and enclosed spaces; #14 addresses respirator requirements based on duration of task; #15 addresses minimizing dust emissions; #17 addresses demolition hammers with bushing tools; #18 addresses tile saws. For more information, see https://www.osha.gov/dsg/topics/silicacrystalline/construction_info_silica.html.

Employees engaged in the Table 1 task means the equipment operator; helpers, laborers and other employees who are assisting with the task; or any other employee responsible for completing the task. For example, an employee operating a walk-behind saw and another employee helping the operator guide the saw are both engaged in the task. An employee operating a jackhammer would be engaged in the task, but another employee directing traffic near the employee jackhammering would not be engaged in the task. OSHA’s Small Entity Compliance Guide for the Respirable Crystalline Silica Standard for Construction, page 5.
